the app market is extremely competitive with users typically having several alternative app possibilities to attract and retain users it is imperative for developers to consider the ratings and reviews their apps receive app reviews frequently contain feature requests sometimes hidden among complaints developers use these complaints and requests to improve their apps thus increasing their rating which is incredibly important for attracting new users unfortunately developers of new apps are at a severe disadvantage they do not have the benefit of existing reviews with only the reviews of similar apps to potentially rely upon to address this problem we conducted a study and developed a novel technique that extracts feature requests from similar existing apps to help prioritize the features and requirements important in an initial app release we compared different classification models in order to identify most appropriate classifier for classifying reviews category wise we found that there is not one single classifier that could have a higher accuracy than others for all categories our study also involved extracting features from user reviews in the google play store the features were presented to 17 android developers twice once without applying our technique and once after applying our technique our proposed technique created a 48 reduction in the number of features considered high priority by participants helping developers focus on what features to consider for their apps we surprisingly found that the frequency of requested features did not impact the developer s decisions in prioritizing the features in the inclusion of new apps abstract
