this book provides for the first time a unified approach to the application of mri in

radiotherapy that incorporates both a physics and a clinical perspective readers will find detailed information and guidance on the role of mri in all aspects of treatment from dose planning with or without ct through to response assessment extensive coverage is devoted to the latest technological developments and emerging options these include hybrid mri treatment systems such as mri linac and proton guided systems which are ushering in an era of real time mri guidance the past decade has witnessed an unprecedented rise in the use of mri in the radiation treatment of cancer the development of highly conformal dose delivery techniques has led to a growing need to harness advanced imaging for patient treatment with its flexible soft tissue contrast and ability to acquire functional information mri offers advantages at all stages of treatment in documenting the state of the art in the field this book will be of value to a wide range of professionals the authors are international experts drawn from the scientific committee of the 2017 mr in rt symposium and the faculty of the estro teaching course on imaging for physicists

external beam radiotherapy has long been challenged by the simple fact that patients can and do move during the delivery of radiation recent advances in imaging and beam delivery technologies have made the solution adapting delivery to natural movement a practical reality adaptive motion compensation in radiotherapy provides the first detailed treatment of online interventional techniques for motion compensation radiotherapy this authoritative book discusses each of the contributing elements of a motion adaptive system including target detection and tracking beam adaptation and patient realignment treatment planning issues that arise when the patient and internal target are mobile integrated motion adaptive systems in clinical use or at advanced stages of development system control functions essential to any therapy device operating in a near autonomous manner with limited human interaction necessary motion detection methodology repositioning techniques and approaches to interpreting and responding to target movement data in real time medical therapy with

external beams of radiation began as a two dimensional technology in a three dimensional world however in all but a limited number of scenarios movement introduces the fourth dimension of time to the treatment problem motion adaptive radiation therapy represents a truly four dimensional solution to an inherently four dimensional problem from these chapters readers will gain not only an understanding of the technical aspects and capabilities of motion adaptation but also practical clinical insights into planning and carrying out various types of motion adaptive radiotherapy treatment

evolvability the ability to respond effectively to change represents a major challenge to today s high end embedded systems such as those developed in the medical domain by philips healthcare these systems are typically developed by multi disciplinary teams located around the world and are in constant need of upgrading to provide new advanced features to deal with obsolescence and to exploit emerging enabling technologies despite the importance of evolvability for these types of systems the field has received scant attention from the scientific and engineering communities views on evolvability of embedded systems focuses on the topic of evolvability of embedded systems from an applied scientific perspective in particular the book describes results from the darwin project that researched evolvability in the context of magnetic resonance imaging mri systems this project applied the industry as laboratory paradigm in which industry and academia join forces to ensure continuous knowledge and technology transfer during the project s lifetime the darwin project was a collaboration between the embedded systems institute the mri business unit of philips healthcare philips research and five dutch universities evolvability was addressed from a system engineering perspective by a number of researchers from different disciplines such as software electrical and mechanical engineering with a clear focus on economic decision making the research focused on four areas data mining reference architectures mechanisms and patterns for evolvability in particular visualization modelling and economic decision

making views on evolvability of embedded systems is targeted at both researchers and practitioners they will not only find a state of the art overview on evolvability research but also guidelines to make systems more evolvable and new industrially validated techniques to improve the evolvability of embedded systems

Bálint's syndrome is named after the Hungarian physician who first reported a remarkable case of a man with complex visuospatial deficits following bilateral lesions within parietal and occipital cortex. Bálint (1909) described the syndrome as having three primary symptoms: simultanagnosia (impaired spatial awareness of more than one object at a time), optic ataxia (misreaching to visual targets), and ocular apraxia (described by Bálint as psychic paralysis of gaze). Bálint's patients not only cannot perceive more than one object at a time and therefore show poor comprehension of multi-object visual scenes (i.e., poor detection of all the objects present and difficulty in grasping the relationship between them), but in addition they typically fail to reach towards the location of the single object which they can perceive. The deficit of the allocation of spatial attention in Bálint's syndrome has been linked to a problem in feature binding which results in illusory conjunctions. Patients with Bálint's syndrome also show deficits in global processing (i.e., when integration of multiple local elements into global compound shapes is required). Consequently, Bálint's syndrome provides a unique opportunity to study the nature and neuroanatomy of human visuospatial processing, in particular multi-level object representation, spatial awareness, and the distribution of visual attention. The studies collected here cover both the anatomical and the cognitive mechanisms of the different symptoms associated with the syndrome. Furthermore, the dissociations between the components of Bálint's syndrome, in particular simultanagnosia and optic ataxia, can also co-occur with visual neglect and extinction, and the different combinations of reported lesions raise a question about the status of the syndrome and whether it should be merely treated as a historical compilation of symptoms which may or may not coexist cohesively.
